

Name: Rajesh Kumar Role: Senior Software Engineer	Goals: • Successfully book a confirmed Tatkal ticket during peak hours (10:00 AM/11:00 AM).
Computer Science Course: Intro to Programming (240 students) Tech Comfort: High	• Ensure fair processing: Wants assurance that if he requests first, he gets served first (FIFO). • Data Consistency: Wants to avoid scenarios where money is deducted but the ticket is not booked. • Real-time accuracy: Needs to see actual seat availability without caching errors.
Quote: <i>“I have the fastest internet and click exactly at 10:00 AM, yet the system crashes or spins indefinitely. It feels like a lottery rather than a booking system. I just want a fair chance.”</i>	Frustrations/Pain Points: • System Crashes: The page becomes unresponsive or throws 504 errors during the booking window. • Race Conditions: Seeing "Available" seats turn to "WL" instantly after payment. • Double Booking: Fear of booking conflicts or transaction failures. • Unfairness: Losing tickets to script/bot users or random system lag.

Empathy Map:
